General Information

OUTPOST NURSERIES are growers of a complete assortment of Plant Materials as listed in this catalogue.

OUTPOST SERVICE includes the supplying of Plant Materials at our Nurseries; delivery to the client's property, or delivery and planting by an experienced Planting Crew in charge of a Landscape Foreman.

OUTPOST SERVICE also includes assistance in design; the selection and arrangement of materials, and advice on the culture and maintenance of Trees and Plants. Frequent inspections are made of our recent plantings without cost or obligation to the client.

OUTPOST PLANT MATERIALS AND SERVICE are available to the client either directly or through a Landscape Architect.

SELECTION—Clients are cordially invited to personally select their Trees and Plants.

PRICES in this catalogue cancel all previous listings, and are subject to change without notice. Prices include loading on trucks at our nurseries, or are F.O.B. our shipping station, and include packing, except on material dug B&B, and on special bulky pieces, shipped by freight or express, for which material used in packing is charged additional at cost.

B&B—Some Plant Materials may be planted successfully with bare roots. Some Plant Materials of certain sizes and varieties require digging with a ball of earth to prevent the roots being disturbed. This ball of earth is securely wrapped and laced in burlap. This is referred to as "balling and burlapping"—B&B. Large and heavy balls are mounted on platforms.

All prices for balling and burlapping are based on what we consider a sufficient ball in proportion to the caliper and/or size of the Tree or Plant.

DELIVERIES can be made by truck to almost any point at a moderate cost, depending on the distance and quantity of material. Prompt shipment can be made by freight, carload lots or less, and by express.

MEASUREMENTS—All sizes are approximated as closely as possible. See details regarding particular group under Deciduous Trees, Evergreen Trees, et cetera.

HARDINESS OF STOCK—Although within easy motoring distance of New York City (turn to map) Outpost Nurseries are located in the foothills of the Berkshires where severe weather is experienced in the Winter season. This insures our stock being thoroughly acclimated and perfectly hardy.

CERTIFICATION OF STOCK—All stock is free of injurious plant diseases and insects. Our Nurseries are regularly inspected by Federal and State authorities. Certificate of inspection accompanies each order.

TERMS—Thirty days net to those whose responsibility is known to us, unless other arrangements are made at time of acceptance of order.
All accounts are payable to Outpost Nurseries, Inc., and not to individuals.

CLAIMS—When stock is not delivered by our truck, our responsibility ceases upon delivery of stock in good condition to transportation company. Claims for damage while stock is in transit should be made promptly to the transportation company.

GUARANTEE—Except for Roses and Perennials, we guarantee to replace without charge Nursery Grown Plant Material supplied from our Nursery and planted by us, that dies from natural causes within one year after planting, provided this material has received normal care, and provided payments have been made promptly as arranged. This guarantee excludes fatalities from tornado, severe drought, abnormal winter or other conditions over which we have no control.

CORRESPONDENCE — Correspondence should be addressed to Outpost Nurseries, Inc., Ridgefield, Conn., and not to individuals.

NOMENCLATURE — Recommendations of "Standardized Plant Names" are used as far as possible.

DECIDUOUS TREES

●

Deciduous Trees drop their foliage in late Fall and Winter.

QUERCUS RUBRA—RED OAK

Except in such varieties where heights only are given, Deciduous Trees are measured by their caliper, i. e., the diameter of the trunk six inches above the ground for Trees up to six inches caliper. Trees six inches, or over in caliper are measured one foot above the ground.

Sizes in caliper as catalogued include Trees measuring the smaller size, or between the two sizes given, but do not include Trees measuring the larger size. Example: Tree measuring 3¼ inches rates as 3 to 3½ inches; Tree measuring 3½ inches, rates as 3½ to 4 inches.

Heights given with caliper measurements are general averages, and are approximate only. Where no caliper appears, height is the governing measurement.

Trees not marked "B&B" (Balled and Burlapped) can be moved with bare roots when dormant. Should balling and burlapping be desired on such Trees, an extra charge will be made at the following rates.

2-3 inches caliper	$2.50 each
3-4 inches caliper	4.00 each
4-5 inches caliper	6.00 each

See General Information for further details on balling and burlapping.

Also see Lists, front of book, for further information.

CHAMAECYPARIS — CYPRESS

Often called Retinospora; common name of this genus is Cypress, but is not to be confused with the famous Cypress of the South, which is of the genus Taxodium.

See Taxodium distichum.

Vary greatly in habits of growth from tall pyramidal Trees to low prostrate plants; many curious and beautiful forms have been developed by propagation from young Trees. The Chamaecyparis are greatly benefited by frequent shearing to develop compact foliage and to keep to desired size.

* Supply very limited.

OUTPOST PLANT FOOD

OUTPOST PLANT FOOD is a perfectly blended and balanced formula for feeding trees, plants and lawns.

Well-rotted manure is primarily organic, but is expensive, unpleasant to handle, hard to obtain, often contains a quantity of weed seeds and is deficient in nitrogen, the element which makes green growth. Many commercial fertilizers are of chemical origin with a high percentage of nitrogen, but are deficient in organic matter which is necessary to build up the soil physically and feed plants properly over any length of time.

OUTPOST PLANT FOOD contains 75 percent organic matter and is made of things plants relish,—blood, bone, fish, cottonseed meal, **et cetera.** All these are not only rich in the necessary chemical elements, but are organic, and, as they decompose, feed the trees or plants over a period of months and add humus to the soil, leaving it in better physical condition. There are just enough chemicals added to begin feeding the plant immediately and give it the quick pick-up it needs.

Many states, including Connecticut and New York, require that samples of all fertilizers sold in the state, be submitted to the state Department of Agriculture for analysis. This analysis determines whether or not fertilizers come up to the standards claimed by the sellers. Since **OUTPOST PLANT FOOD** was first offered for sale, it has consistently tested higher and proved much finer than Outpost Nurseries claim it to be.

Trees, plants, and lawns are bound to do better if fed with **OUTPOST PLANT FOOD.**

HELPFUL SUGGESTIONS

About Planting

Start planting most sizes of shade, ornamental and fruit trees as early in the spring as the ground is workable — in the fall after a "killing" frost.

Start planting evergreen trees and broad-leaved evergreens, flowering shrubs, vines and perennials a little later in the spring — a month earlier in the fall.

Tea Roses are best planted in the spring — about April 20th if bare rooted — during May and June if potted.

Mature shade and ornamental trees having large balls of soil can be planted throughout the winter months.

Burlap covering balls of soil on balled and burlapped trees, should be removed before planting, if trees are of a size which can be handled easily.

Burlap on large balls of soil, if not entirely removed, should be freed of ropes and cut away as low down as possible after trees are set in planting holes and properly faced.

Fill planting holes with water after trees are set in place and half the planting soil has been replaced.

About Planting (Cont.)

After settling has taken place (20 minutes), fill in balance of soil, leaving this loose and slightly depressed toward the trunk of the tree.

On larger trees a water-retaining soil cup is helpful if placed just outside the ball area.

Guy tall trees with wire run through rubber hose where it contacts the tree.

This method is better than tramping soil tightly around the tree trunk, and it makes a more permanent stabilizer.

About Watering

In dry weather water **thoroughly** twice a week and allow the soil to aereate between each watering.

A hose, lying on the ground and running gently without a nozzle, for an hour or two will do a much better job than can be done by any other method.

Do not wet the foliage of plants during the heat of the day, as the sun may scald, causing discoloration, wilting or unsightly spots.

About Pruning

All shade, ornamental and fruit trees, as well as all flowering shrubs should be carefully pruned at time of transplanting.

About Pruning (Cont.)

Pruning can best be done after the material has been set and properly faced, as desired shape can then be determined.

No set rule can be given for pruning, as to the amount of growth to remove.

The principle involved is the correct balance between the root system and the top growth.

As the root system suffers a shock in transplanting, the feeding load should be lightened by reducing the wood in the top of the tree or shrub.

All types of trees and plants can and should be pruned (or sheared) to some degree, after established, to maintain compactness and vigor.

Balled and burlapped shade trees and flowering shrubs are more costly than bare rooted ones, but usually need somewhat less pruning when transplanted and therefore assume definite shapes more quickly.

Prune shade, ornamental and fruit trees in early spring as soon as severe weather has passed.

Mid-summer and fall blooming shrubs (types which bloom on new growth) should be pruned in early spring quite severely. The more new growth the more blooms there will be. Hybrid Tea Roses also come in this group.

About Pruning (Cont.)

Spring and early summer blooming flowering shrubs, climbing and shrub roses, should be pruned soon after blooming, in the summer months.

Evergreen trees of all types may be sheared with beneficial effect. This work is usually done in the late spring at the time that new growth starts.

The fine-foliaged evergreens should be sheared at the tips — the coarser types carefully clipped in and out in irregular outline, the cuts to be made just above branch whorls, where new growth will start.

About Spraying

There are many prepared sprays on the market. They are designed to do three things :

Kill chewing insects by a stomach poison.

Kill sucking insects (including forms of scale) by contact.

Control fungus diseases by application of a fungicide previous to or at the time of attack.

When fighting an infestation, results will be surer if you can determine which of the types of injury are involved and make sure your spray meets the situation.

LARGE TREE MOVING

LARGE TREE MOVING (Cont.)

With skill and efficient handling, we have simplified Large Tree Moving to a degree that makes it possible for you to save many years of waiting for small trees to mature, and we can plant such trees at a minimum cost.

An interesting and informative 24 page illustrated brochure entitled "Trees", is available on request.

If you have a problem involving the selection and proper placing of large trees, our representative in your section will gladly call by appointment, and discuss this problem with you, without obligation.

GENTLEMEN :

☐ Kindly send me your illustrated brochure on "Trees".

☐ Kindly have your representative call me for an appointment to discuss my planting problem.
